

RÖNNBERG CLOCK TO GATE

<http://familjenronnberg.se/~niklas/diy/eurorack/clk2gate/>

This is a really convenient module! It's a clock pulse or trigger to gate converter. It has a clock input, a buffered clock output, a duration control and two gate outputs. It has a LED that indicates a trig input when orange and the gate output when green.

Unfortunately there are no building instructions for this module, but at least you'll find the schematic, some photos, and some comments.
